

Ideation Phase

Brainstorm & Idea Prioritization – Script-Controlled ACL

Date	03 October 2026
Team ID	To be provided
Project Name	Script-Controlled ACL – Restrict Record Access Based on Field Value
Maximum Marks	4 Marks

Brainstorm & Idea Prioritization Template:

The team brainstormed ways to prevent unauthorized record visibility and lifecycle changes in ServiceNow while keeping legitimate EEE branch work efficient.

Ideas were grouped by access policy, data conditions, operations, testing, governance, and usability. Priorities reflect security impact, feasibility, and alignment with the supplied lab scope.

Reference: <https://www.mural.co/templates/brainstorm-and-idea-prioritization>

Step-1: Team Gathering, Collaboration and Select the Problem Statement

Selected problem statement: ServiceNow users need record-level access based on both assigned roles and the Branch value, but broad or incomplete ACL rules can expose or alter institution records without authorization.

Stakeholders: ServiceNow administrator, EEE branch user, data owner, tester, project manager, and product owner.

Step-2: Brainstorm, Idea Listing and Grouping

Access policy ideas: Branch-aware Read ACL; admin override; role matrix; separate operation ACLs; direct-record denial checks.

Testing and governance ideas: u_institution_details with ECE/EEE/CSE test data; roles bb1–bb4; impersonation tests; ServiceNow ATF automation; audit dashboard; periodic role review; disposable records for Delete tests; performance and concurrency checks.

Step-3: Idea Prioritization

- 1. High – Implement advanced Read ACL with admin override, bb1 role, and Branch = EEE condition.**
- 2. High – Add separate Create/bb2, Write/bb3, and Delete/bb4 ACLs.**
- 3. High – Create positive and negative tests for every role/Branch/operation**

combination.

4. Medium – Add ATF regression and audit reporting.

5. Medium – Add role governance and clear access-denied guidance.

6. Low – Expand rules to additional branches and portal-specific usability improvements.
