

Project Design Phase
Problem–Solution Fit — ACL Access Control

Date	2 October 2026
Team ID	
Project Name	Script-Controlled ACL — Branch-Based Record Access
Maximum Marks	2 Marks

Problem–Solution Fit Summary:

This ServiceNow training lab addresses a concrete access-control problem: institution-detail records span ECE, EEE, and CSE branches, but not every user should be able to read or change every record. The proposed fit is a role-gated record ACL design that limits EEE reads to EEE records and gates create, write, and delete operations by separate roles.

Fit hypotheses and design goals (not yet validated with live customers):

- ☐ EEE users need to find and read records for their own branch without seeing ECE or CSE records.
- ☐ Administrators need broad access to administer the lab; this is explicitly stated for READ and should be verified for other operations in the instance.
- ☐ Separate bb2, bb3, and bb4 roles can make CREATE, WRITE, and DELETE permissions easier to reason about and test.
- ☐ Native ServiceNow record ACLs are the intended enforcement point; lists, forms, and Service Portal are interfaces, not substitutes for server-side ACL checks.
- ☐ This is a three-hour instructional lab, not evidence of market demand, customer interviews, deployment success, or measured adoption.

Filled Problem–Solution Fit Canvas

Canvas area	ACL lab interpretation
1. Customer segment(s)	ServiceNow administrators/platform owners configuring a training instance; EEE users who need branch-specific reads; and users without the required roles. These are lab stakeholders, not validated commercial segments.
6. Customer constraints	Access depends on correct role assignment, an active table ACL, and accurate Branch values. The lab assumes an authenticated ServiceNow instance. Production requirements, support needs, and data-governance constraints are not specified.
5. Available solutions	The source uses native ServiceNow record ACLs, role requirements, a Branch = EEE data condition, and a script for the administrator/bb1 read check. It does not compare other products or document an existing deployed solution.
2. Jobs-to-be-done / problems	Protect u_institution_details records; allow bb1 users to read EEE-branch records only; require bb2 to create, bb3 to write, and bb4 to delete. Administrators need the access described by the lab.
9. Problem root cause	A broad table permission or a single undifferentiated role can expose or alter records beyond the intended scope. Read access needs both role logic and a branch condition; other CRUD operations need their own explicit checks.
7. Behaviour	A user opens a list/form or attempts a table operation. ServiceNow evaluates the relevant record ACL; a passing check allows the operation and a failing check blocks it. This is the intended flow, not observed customer behaviour.
3. Triggers	A user requests to view, create, edit, or delete a record; an administrator changes a role or ACL; or a record's Branch value changes. No external demand or purchase trigger is documented.
10. Your solution	Create Institution Details (u_institution_details) with Branch choices ECE, EEE, and CSE. READ: admin exception or bb1, with the separate Branch = EEE data condition. CREATE: bb2; WRITE: bb3; DELETE: bb4. Source specifies no data condition for the latter three.
8.1. Online channels of behaviour	ServiceNow lists and forms; the source also names Service Portal in the intended outcome, where that interface is enabled. All entry points must still be protected by the ACL layer.
8.2. Offline channels of behaviour	None specified. The described lab is performed in ServiceNow; no offline/manual access process or channel is documented.
4. Emotions: before / after	Hypothesis only: before, users/admins may be uncertain about who can access branch records; after, clear permissions should improve confidence in appropriate access. No interviews or satisfaction measurements were supplied.
