

Project Design Phase

Proposed Solution — ACL Access Control

Date	2 October 2026
Team ID	
Project Name	Script-Controlled ACL — Branch-Based Record Access
Maximum Marks	2 Marks

Proposed Solution — Script-Controlled ACL:

The project is a ServiceNow instructional configuration for branch-scoped READ access and role-gated record operations. The descriptions below are limited to the supplied lab; they do not claim a production deployment or commercial product.

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	Protect Institution Details (u_institution_details): let authorized EEE users read EEE records while restricting CREATE, WRITE, and DELETE to their designated roles. The lab describes administrator access; verify actual instance behaviour for each operation.
2.	Idea / Solution description	Configure the custom table with ECE/EEE/CSE Branch values. READ: admin exception or bb1, plus the Branch = EEE data condition. CREATE requires bb2; WRITE requires bb3; DELETE requires bb4. The source specifies no data condition for CREATE/WRITE/DELETE.
3.	Novelty / Uniqueness	No commercial novelty is claimed. The instructional combination is operation-specific roles (bb1–bb4), a Branch = EEE READ filter, and an administrator exception in a ServiceNow ACL lab. Comparison with other implementations was not provided.
4.	Social Impact / Customer Satisfaction	Intended impact: reduce unauthorized exposure or modification of institution records and give authorized EEE users predictable, branch-scoped reads. This is a security goal; no impact study or satisfaction evidence was supplied.
5.	Business Model (Revenue Model)	Not specified. The source describes a three-hour educational lab, not a product/service, customer contract, pricing, or revenue model. Treat this as a learning exercise rather than a commercial venture proposal.
6.	Scalability of the Solution	The pattern could be extended to additional tables, branches, roles, or operations, subject to design and testing. The source defines one table and three branches; deployment scale, performance, and operational readiness are untested.

Source and scope: based on the user-supplied ACL lab; no customer validation, commercial differentiation, or production deployment evidence was provided.
